The Pain !

- Every bridge, aircraft, and vehicle undergoes rigorous testing and simulations before deployment. This helps identify failure points before real-world consequences.
- Yet lawyers file million-dollar lawsuits without ever testing their arguments against a simulated opponent.
- Lawyers spend countless hours crafting arguments, but zero hours testing them against realistic opposition.
- They discover weaknesses only after opposing counsel attacks in court.
- A weak document leads to weak settlements or dismissed cases. The "Wait and See" approach costs clients billions annually.

Solution

Protego offers an **Adversarial AI simulation system** for litigators.

The core – **Draft** → **Attack** → **Fortify**

Draft

Our AI writes the initial legal argument, analyzing precedents and crafting compelling narratives based on case facts.

1

Attack

A second "Opposing Counsel" AI aggressively tries to destroy the argument—finding loopholes, missing facts, weak logic.

2

Fortify

The system automatically fixes the document based on the attack, strengthening weak points and closing loopholes.

3

" Lawyers enter the courtroom with a battle-tested document that has already survived the toughest possible scrutiny. "

Market Opportunity

- 95–97% of civil Lawsuits never even reach Trial
- The settlement amount isn't decided in the courtroom, it's decided by the pre-trial paperwork.
- US Legal Services Market is valued at ~\$400 Billion.
- Litigation remains the largest revenue generating service segment within this industry.

*If you dominate the paperwork, you dominate the settlement.
This is where cases are won or lost, long before trial.*

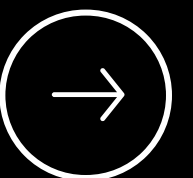

Key Features

- *Specialized AI Agents* generate Pre-trial documents like *Complaints, MODs, Answers etc.. with strong legal research and traceability.*
- *Test the document against **Opposing Counsel AI agents***
- *The simulation cycle continues till the document strength threshold is reached.*
- *Also designing the workflows with **Judge Agents** that simulate judicial rulings*

Building a future where legal strategy is data-driven, battle-tested, and predictable.

Lawyers don't just file documents, they file winners.

System Features

- Individual **Vector Databases** for each State and Federal jurisdiction.
- **Specialized AI Agents** use **Tools** to query external Legal Databases for real-time precedents.
- Every generated argument is backed by cited case law.
- **Model Context Protocol (MCP) server** to host all tools, database connections, and system prompts.
- Our system uses **Graph-Based Workflows**. This enables the iterative "Draft → Critique → Refine" cycle that simulates the adversarial process.
- **Authentication and Authorization** implemented to the atomic granular level, each agent has permissions to use only certain tools and documents.
- Stricter statemanagement and context flow control.

Competitive Analysis

It is true that there are some strong companies in Legal AI space.
But, their focus is purely on **generative ai tools**.

Why US

The Fundamental difference in Approach

Everyone else Generates, We test !

Companies like Harvey, EvenUP, LegalMation are focusing solely on text generation.

Transformation from Generative AI to Agentic AI workflows is happening and is the natural step forward.

It's high time we bring that to the field of LAW

We account the “Adversarial Nature” of Law into account while we draft documents.

We create Agentic AI workflows that mimic the actual court process.

We don't just generate and forget, we test strategy, we simulate the opposing counsel, we fortify the document.

Current State

- Currently in Systems Design phase, dissecting into smallest possible elements, so that development becomes easier.
- Trying to connect with Lawyers for real validation.
- Started working in Figma for a small mockup

Thank you
